## Table of Contents

# Section 1    Specifications

*ECO* sensors measure different parameters of the Earth's natural waters. The sensors are available in several models and with a variety of optional features.
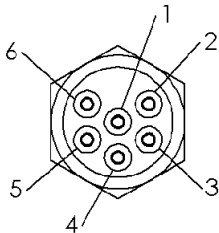

| | |
|---|---|
| Real-time (**RT**) | Output is digital or analog. Operates continuously. Does not store data. |
| Real-time deep (**RTD**) | 6,000 m rated depth. Does not store data. |
| Standard | Output is digital or analog. Has low power mode. Stores data. |
| Bio-wiper (**S**) | Standard, and with Bio-wiper to prevent bio-fouling. |
| Battery (**B**) | Standard, and with internal batteries. |
| Bio-wiper and battery (**SB**) | Standard, with both a Bio-wiper and internal batteries. |

*Note: The three-parameter sensor is available in Standard and Battery models only and has no analog output.*

## 1.1  Mechanical

| | RT, standard | RTD | S | B, SB |
|---|---|---|---|---|
| Diameter | 6.30 cm | | | |
| Length | 12.70 cm | 17.68 cm | 13.3 cm | 28.00 cm |
| Depth rating | 600 m | 6000 m | 300 m | |
| Temperature range | 0–30 °C | | | |
| Weight in air, water | 0.40 kg, 0.02 kg | 1.3 kg, 0.75 kg | 0.50 kg, 0.08 kg | 0.96 kg, 0.14 kg |
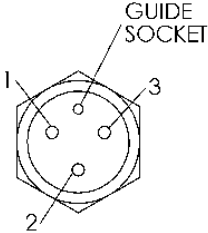

### 1.1.1  Standard bulkhead connector

| Contact | Function | MCBH-6-MP connector |
|---|---|---|
| 1 | Ground | |
| 2 | RS232 RX | |
| 3 | Reserved Analog 2 (FLNTU only) | |
| 4 | Voltage in | |
| 5 | RS232 TX | |
| 6 | Analog 1 | |

### 1.1.2  Battery

**Additional bulkhead connector on sensors with internal batteries.**
**Use the three-contact blue-tipped power connector that is supplied with the sensor to supply power to the sensor.**

| Contact | Function | MCBH-3-FS connector |
|---|---|---|
| 1 | Voltage in | |
| 2 | No connect | |
| 3 | Battery out | |

## 1.2 Electrical

| | |
|---|---|
| Input | 7–15 VDC |
| Current draw, typical | 50 mA; 60 mA (triplet) |
| Current draw, standby | 140 µA |
| Current draw, active wiper | 140 mA |
| Linearity | 99% |

## 1.3 Communications

| | Fluorometer | NTU | Scattering | FLNTU | Triplet |
|---|---|---|---|---|---|
| Sample rate | to 8 Hz | | | | to 4 Hz |
| Data storage | 108000 samples | | | 90000 samples | 77000 samples |
| RS232 output rate | 19200 baud | | | | |
| Data resolution | 14 bit | | 12 bit | | |
| Digital output maximum | ~16380 counts | | 4130 ±30 counts | | |
| Analog output maximum | 5 V | | | | no analog |

## 1.4 Optical

**Note**: The manufacturer has changed the nomenclature for the output of all dissolved organic matter fluorometers. Fluorescent dissolved organic matter (FDOM) replaces colored dissolved organic matter (CDOM). FDOM aligns the fluorescence measurement with the output description.

### 1.4.1 Single-parameter fluorometer

| Parameter | Wavelength EX/EM | Range, Sensitivity |
|---|---|---|
| Chlorophyll (Chl) | 470/695 nm | 0–125, 0.016 µg/L |
| Fluorescent Dissolved Organic Matter (FDOM) | 370/460 nm | 0–500, 0.093 ppb |
| Uranine (UR) | 470/530 nm | 0–400, 0.05 ppb |
| Phycocyanin (PC) | 630/680 nm | 0–230, 0.030 ppb |
| Phycoerythrin (PE), Rhodamine (Rh) | 530/595 nm | 0–230, 0.030 ppb |

### 1.4.2 Single-parameter scattering

| Parameter | Wavelength | Range, Sensitivity |
|---|---|---|
| Scattering | 470 nm, 532 nm, 650 nm | 0–5, 0.003 m$^{-1}$ |
| | 700 nm | 0–3, 0.002 m$^{-1}$ |
| | | 0–5, 0.003 m$^{-1}$ |

### 1.4.3  Two-parameter fluorometer-turbidity

| Parameter | Wavelength EX/EM | Range, Sensitivity (chl) | Parameter | Wavelength | Range, Sensitivity (NTU) |
|---|---|---|---|---|---|
| Chlorophyll | 470/695 nm | 0–30, 0.015 µg/L<br>0–50, 0.025 µg/L<br>0–75, 0.037 µg/L<br>0–125, 0.062 µg/L<br>0–250, 0.123 µg/L | Turbidity | 700 nm | 0–10, 0.005 NTU<br>0–25, 0.013 NTU<br>0–200, 0.098 NTU<br>0–350, 0.172 NTU<br>0–1000, 0.123 NTU |

### 1.4.4  Three-parameter fluorometer and scattering

| Parameter | Wavelength EX/EM | Range, Sensitivity |
|---|---|---|
| Chlorophyll (Chl) | 470/695 nm | 0–30, 0.015 µg/L |
|  |  | 0–50, 0.025 µg/L |
| Fluorescent Dissolved Organic Matter (FDOM) | 370/460 nm | 0–375, 0.184 ppb |
| Uranine (UR) | 470/530 nm | 0–300, 0.073 ppb |
| Phycocyanin (PC) | 630/680 nm | 0–175, 0.086 ppb |
| Phycoerythrin (PE), Rhodamine (Rh) | 530/595 nm | 0–175, 0.086 ppb |

| Parameter | Wavelength | Range, Sensitivity |
|---|---|---|
| Scattering | 412 nm, 470 nm, 532 nm, 650 nm, 880 nm | 0–5, 0.003 m$^{-1}$ |
|  | 700 nm | 0–3, 0.002 m$^{-1}$ |
|  |  | 0–5, 0.003 m$^{-1}$ |

# Section 2    Operation and maintenance

## 2.1  Verify sensor operation

> ### ⚠ WARNING
>
> FDOM sensors use an ultraviolet LED light source. Do not look directly at a UV LED when it is on. It can damage the eyes. Keep products that have UV LEDs away from children, pets, and other living organisms. Wear polycarbonate UV-resistant safety glasses to protect the eyes when a UV LED is on.

> ### ⚠ CAUTION
>
> Do not supply more than 15 VDC to the sensor. More than 15 VDC will damage the wiper.

Make sure that the sensor operates before further setup and deployment.

1. Connect the 6-contact connector on the optional test cable (refer to the section on the test cable for details) to the sensor.
2. Remove the cap that protects the optical face of the sensor.
3. Connect a serial-to-USB adapter to the test cable to connect the test cable to the PC.
4. Connect the sensor to a power supply:

   - Connect sensors with internal batteries to the manufacturer-supplied, three-contact, blue-tipped power connector. The sensor comes on.
   - Connect sensors without internal batteries to the optional test cable and a regulated power supply set at 12 VDC.

5. Start the software from the manufacturer-supplied CD.

   a. Select the COM port on the PC.
   b. Select the device file for the sensor from the CD.
   c. Select the baud rate if necessary. The default is 19200.

6. Turn on the power supply.
   The sensor comes on.
7. Push **Start Data**.
8. Go to the *Raw Data* tab of the software.
   The data collected by the sensor shows in the "Signal" column.

---

**Figure 1  Format of data collected by real-time sensors**

**Figure 2  Format of data collected by most ECO sensors**

| Meter Setup | Raw Data | Plot Data | Transfer Data |

| 06/14/12 06:06:05 532 | 267 | 660 | 3070 | 695 | 78 |
| 06/14/12 06:06:06 532 | 315 | 660 | 3406 | 695 | 89 |
| 06/14/12 06:06:07 532 | 437 | 660 | 3861 | 695 | 127 |
| 06/14/12 06:06:08 532 | 509 | 660 | 4122 | 695 | 175 |
| 06/14/12 06:06:09 532 | 2577 | 660 | 4122 | 695 | 629 |
| 06/14/12 06:06:10 532 | 4122 | 660 | 4122 | 695 | 957 |
| 06/14/12 06:06:11 532 | 4122 | 660 | 4122 | 695 | 970 |
| 06/14/12 06:06:12 532 | 4122 | 660 | 4122 | 695 | 868 |
| 06/14/12 06:06:14 532 | 4122 | 660 | 4122 | 695 | 946 |

Date  Time  Wave-length  Signal  Wave-length  Signal  Wave-length  Signal

*Note that RT and puck sensors show 9's instead of the Date and the Time.*

9. Look at the maximum data value for the sensor. Hold a finger, the protective cap, or fluorescent stick if the sensor is a fluorometer, 1–4 cm away from the optical face of the sensor.
The data value in the "Signal" column in the *Raw Data* tab will increase toward the maximum data value specified for the sensor.

- • Scattering and turbidity sensors: use a finger or the protective cap.
- • FDOM sensors: use the blue fluorescent stick.
- • Chlorophyll or phycoerythrin sensors: use the orange fluorescent stick.
- • Uranine or phycocyanin sensors: use the yellow fluorescent stick.
- • PAR sensors: point the sensor into the light.

10. Push **Stop Data**.
The Bio-wiper closes on sensors so-equipped. If the power is turned off in mid-cycle, the Bio-wiper starts at the beginning of the cycle when power is supplied again.

## 2.1.1  Verify analog data output

1. Connect the optional test cable to the sensor. Refer to the section on the Test cable for details about test cables.
2. Use a regulated power supply to supply 12 VDC to the sensor or connect a 9V battery to the connectors on the test cable.
The sensor comes on.
3. Use the probes on a digital multimeter (DMM) to touch the RCA connector on the auxiliary leg(s) of the test cable.
4. Put the red (signal) probe in the RCA connector and the black (ground) on the outside.
The DMM shows near 0 VDC.
5. Put the fluorescent stick (for fluorometers) or a solid object near the light source of the sensor.
The DMM shows near 5 VDC.

## 2.2  Monitor data

Monitor the data from the sensor in counts. The number of "Signal" or columns of data will vary depending on whether the user has a one-, two-, or three-parameter sensor.

1. Make sure the sensor has power supplied and is on.
2. Push **Start Data**.
3. Go to the *Raw Data* tab to see the data that is collected by the sensor.
Refer to the Verify sensor operation on page 7 illustration to see the format of the data.
***Note:** RT and puck sensors usually show 9's as placeholders in the date and time columns.*

### 2.2.1 Monitor data collected in engineering units

**1.** Go to the *Plot Data* tab.

**2.** Select "Engr Units" from the drop-down menu near the top of the tab.

**3.** Select the type of units to see.

The software calculates the engineering units to show in the *Plot Data* tab.

*Note: Data is saved in counts, not engineering units.*

## 2.3 Get data from sensor

Use only the batteries recommended by the manufacturer as replacements. Do not mix new and used cells or chemistries.

Get the data from the sensor and save it to the PC.

**1.** Make sure that the sensor is not on but has power supplied to it.

**2.** Select the *Transfer Data* tab in the software.

**3.** Push **Receive Data**.

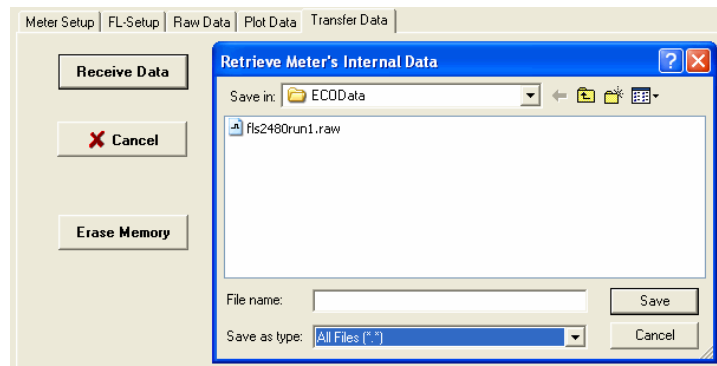

**4.** Select a location on the PC in which to save the data.

**5.** Type a file name in the **Retrieve Meter's Internal Data** window.

**6.** Push **Save**.
The software saves the data from the sensor to the PC.

**7.** Make sure that the data move is complete.

**8.** Open the data file to make sure that the data is on the PC.
Contact the manufacturer to get a spreadsheet template for an *ECO* sensor.

**9.** Push **Erase Memory** to erase the data from the memory of the sensor.

## 2.4 Set up sensor for deployment

1. Refer to the previous section to make sure that the sensor operates correctly.
2. Replace the test cable with a sea cable for deployment.
3. If necessary, remove the protective cap from the sensor.
4. Use either the blue-tipped power connector (sensors with internal batteries only) or an external power supply to supply power to the sensor for deployment. If the power connector and a cable are both attached, the power is supplied by the equipment that supplies the highest voltage.

    a. Attach the blue-tipped power connector to the three-contact connector. The sensor will begin operation as set up by the user. The manufacturer recommends this mode for moored applications.
    b. Attach a sea cable to the six-contact connector and turn on the power supply (sensors without internal batteries).
5. Refer to the section on Additional operations on page 10 for details on how to set up the sensor for a specific application.

## 2.5 Additional operations

*Note: Real-time (RT and RTD) sensors do not store data. Some of the data collection options in this section do not apply to these sensor models.*

### 2.5.1 Set date and time

Make sure that the sensor is connected to a power supply that is turned on. Make sure that the software is open.

1. If the sensor is in operation, push **Stop Data** to stop the sensor.
2. Select the *Meter Setup* tab.
3. Push **Set Date and Time**.
   The software adjusts the time shown by the sensor to agree with the PC.
4. Push **Get Date/Time/Setup** to make sure that the sensor and the PC show the same current time.

### 2.5.2 Adjust options for data collection

The manufacturer sets *ECO* sensors to operate at approximately 1 Hz, with the optional internal data storage turned on.

**Table 1  Options to collect data**

| ECOView option | How it works |
| --- | --- |
| Set Avg/Data Rate | Adjust from 1 to 65535. Examples: |
|  | 1-parameter sensors—approximately 1 Hz = 65; approximately 2 Hz = 30 |
|  | 2-parameter sensors—approximately 1 Hz = 30; approximately 2 Hz = 15 |
|  | 3-parameter sensors—approximately 1 Hz = 18; approximately 2 Hz = 6 |
|  | PAR sensors—approximately 1 Hz = 310; approximately 2 Hz = 170 |
| Set Number of Samples | Adjust from 0 to 65535.<br>Use 0 to operate continuously. |

**Table 1  Options to collect data (continued)**

| The three options below apply only to sensors equipped with internal memory | |
| --- | --- |
| Set Number of Cycles | Adjust from 0 to 65535.<br>Select the number of sample groups that the sensor will collect between low-power states. |
| Set Cycle Interval | Adjust the time interval between sample cycles.<br>Do not type the colons. The minimum is 5 seconds. |
| Turn Logging ON | Push to turn data storage off or on (sensors with internal data storage only). |

Adjust any of the options to collect data in the *Meter Setup* tab.

| 1 | Enter the new value into the variable box. | 2 | Push the related button that is to the left of the variable box. | 3 | Push **Store to Flash**. The new value shows in the column <u>Current Ram Settings</u>. |
| --- | --- | --- | --- | --- | --- |

In the example above, the 3-parameter sensor will operate at an "Average" of 18 and a "Data Rate" of 1.12 Hz. The sensor will collect data 10 rows of data for 3 cycles, with a low-power interval of 15 seconds after each cycle. The sensor stops after the 10th row of the third cycle of data is collected.

**Table 2  Data collection examples**

| Collect moored data | Collect profiling data |
| --- | --- |
| Set Avg/Data Rate = ±1 Hz | Set Avg/Data Rate = ±1 Hz |
| Set Number of Samples = 50 | Set Number of Samples = 0 |
| Set Number of Cycles = 24 | Set Number of Cycles = N/A |
| Set Cycle Interval = 006000 | Set Cycle Interval = N/A |
| Turn Logging ON/OFF = ON | Turn Logging ON/OFF = ON |
| The sensor will collect data once per second, 50 times every 60 minutes for 24 hours, and store the collected data. | The sensor will collect data once per second and store collected data until the power is turned off. |

If the sensor is set up to collect data intermittently, as for a moored deployment, it may be in a low-power condition. It is not possible to communicate with the sensor in this condition.

1. To start communication again, disconnect the sensor's power supply for one minute.
2. Connect the power again and push **Stop Data** several times.
3. Select the *Meter Setup* tab. Refer to <span style="color:blue">Adjust options for data collection</span> on page 10.
4. Type **0** into the **Number of Samples** variable box.
5. Push **Set Number of Samples**.
6. Push **Store to Flash**.
   The sensor operates continuously.

Make sure that the sensor operates continuously.

1. Select the *Raw Data* tab.
2. Push **Start Data**.

3. Let the sensor operate for 10 samples or more.
4. Push **Stop Data**.

### 2.5.3 Adjust views in plot data tab

The *Plot Data* tab in the software lets the user see the data that the sensor has collected.

| Button | Function | Description |
|--------|----------|-------------|
| 1 | Resume | Push to start or stop the data that shows. |
| 2 | Pause | The x-axis will stop. |
| 3 | Axes scroll | Move either axis up or down, or right or left. |
| 4 | Axes zoom | Move either axis up or down, or right or left. |
| 5 | Zoom out | Decrease the detail by 2x. |
| 6 | Zoom in | Increase the detail by 2x. |
| 7 | Zoom box | Draw a box around the data area to zoom all axes. |
| 8 | Cursor | Move the cursor bar to a certain data point. |
| 9 | Copy | Copy the current data plot to the PC clipboard. |
| 10 | Save | Save an image of the current data plot to the PC. |
| 11 | Print | Send a snapshot of the current data plot to a printer. |

Enter the units of data to view from the drop-down menu above the black view area (μg/L, ppb, scattering, etc.)

## 2.6  Sensor maintenance

> **⚠ CAUTION**
>
> Do not use acetone or other solvents to clean any part of the sensor.

1. After each cast or exposure to natural water, flush the sensor with clean fresh water.
2. Use soapy water to clean any grease or oil on the optical face of the sensor. It is made of ABS plastic and optical epoxy and can be damaged if an abrasive cleaner is used.
3. Dry the sensor with a clean soft cloth.

### 2.6.1 Bulkhead connector maintenance

> **⚠ CAUTION**
>
> Do not use WD-40® or petroleum-based lubricants on bulkhead connectors. It will cause damage to the rubber.
> Damaged connectors can cause a loss of data and additional costs for service.
> Damaged connectors can cause damage to the sensor and make it unserviceable.

Examine, clean, and lubricate bulkhead connectors at regular intervals. Connectors that are not lubricated increase the damage to the rubber that seals the connector contacts. The incorrect lubricant will cause the bulkhead connector to fail.

1. Apply isopropyl alcohol (IPA) as a spray or with a nylon brush or lint-free swab or wipes to clean the contacts.
2. Flush with additional IPA.
3. Shake the socket ends and wipe the pins of the connectors to remove the IPA.
4. Blow air into the sockets and on the pins to make sure they are dry.
5. Use a flashlight and a magnifying glass to look for:

| | |
|---|---|
| Cracks, scratches, or other damage on the rubber pins or in the sockets. |  |
| Any corrosion. |  |
| Separation of the rubber from the pins. |  |
| Swelled or bulging rubber pins. |  |

6. Apply a small quantity of 3M™ Spray Silicone Lubricant (3M ID# 62-4678-4930-3) to the pin end of the connector. Make sure to let it dry.
7. Connect the connectors.
8. Use a lint-free wipe to clean any unwanted lubricant from the sides of the connectors.

# Section 3    Reference

## 3.1  Delivered items

- the *ECO* sensor
- a dummy connector and lock collar
- blue-tipped power connector and lock collar for sensors with internal batteries
- a plastic protective cover for the optical face
- a model-specific spare parts kit
- a stainless steel mounting bracket and hardware (Sensors that are depth-rated to 6000m and sensors with internal batteries do not have this bracket.)
- **On the CD:**
- this user manual
- the software
- the device file or files for the sensor
- the characterization or calibration page for the sensor.

## 3.2  Calibration

The manufacturer calibrates all scattering sensors to make sure that the data that is collected meets the specifications for the sensor. This information is on the sensor-specific calibration page that comes with the sensor.

## 3.3  Characterization

The manufacturer uses a fluorescent material to characterize all fluorescence sensors to make sure that the data that is collected meets the specifications of the sensor. This information is on the sensor-specific characterization page that comes with the sensor.

## 3.4  Field characterization

The manufacturer recommends that the user perform a field characterization on fluorometers to make sure that the data is as accurate as possible for the user's application. The scale factor and the dark counts values can vary depending on the natural water, temperature, length of the cable, the power supply, and other factors.

Do the steps below to field-characterize the sensor.

- *x* = a solution of a known concentration in volts or counts.
- **output** = the measured sample of interest in volts or counts.
- **dark counts** = the measured signal output in volts or counts of the sensor in clean water with black tape over the detector.
- **scale factor** = the multiplier in µg/L/volt, ppb/L/volt, OR µg/L/count, ppb/L/count.

1. Get a solution of a known concentration, *x*.
2. Measure and record this solution using the sensor.
   This value is the **output** in volts or in counts.
3. Measure and record the sensor's **dark counts**.
4. Use this equation to determine the sensor's **scale factor:**
   Scale factor = x ÷ (output - dark counts).
5. Use the scale factor to determine the concentration of the sample of interest:
   (output counts - dark counts) × scale factor = concentration of solution.
6. Store the scale factor and dark counts (offset) in the device file for the sensor, the internal memory of the sensor, or both.

### 3.4.1 Save field characterization values in device file

The software uses a device file to process data. Refer to the example below.

*Note: A colon comes before the comments in the device file. The comments are not used by the software.*

```
ECO              FLS-1822
Created on:      04/29/2011

: chl=ug/l.
: iengrunits=µg/l for chl; ppb for PC, PE CDOM and uranine.
: column 4=input the scale factor and offset in this column.
: N/U=not used.

maxvoltage=4.96
asv1=6.2606
asv2=12.5355
asv4=25.2860

COLUMNS=5
N/U=1
N/U=2
N/U=3
Chl=4     0.0052    48
N/U=5
```

1. Replace the values in column 4 of this device file with the scale factor and offset values from the field characterization.
2. Save this device file with a new name.
3. To use this new file in the software, select the *File* menu, then push **Load Device File**.

### 3.4.2 Save field characterization values in sensor

Make sure that the sensor is connected to a 9V battery or power supply and the PC to do these steps.

1. Start the software if necessary.
2. Push **Select COM Port**. Select the communications port on the PC.
3. Push **Device File**. Select the device file from the field characterization.
4. Make sure the sensor is not in operation.
5. Select the *FL Setup* tab.

6. Enter the Scale Factor from the field characterization in the variable box under the Change Settings To column. This is the same value as in the edited device file.
7. Push **Set Engr Scale**.
8. Enter the Offset from the field characterization in the variable box under the Change Settings To column.
9. Push **Set Engr Offset**.
10. Push **Store to Flash**.
    The sensor saves the field characterization values in its memory. The values show under the Current Ram Settings column in the software.

## 3.5 Chlorophyll fluorometer-specific setup

*ECO* sensors that measure only chlorophyll have two device files. One is a standard device file. The other has an additional column that the software uses to give chlorophyll output in µg/L.

1. Edit column 5 of the IENGR device file to show field characterization values.

```
ECO        FL-784
Created on:      07/17/11

:          chl=ug/l
:          iengrunits = µg/l for CHL. ppb for PC, PE, CDOM, uranine.
:          column 5 = input scale factor and offset.

maxvoltage=      4.96
asv1=            6.3834
asv2=            12.7597
asv4=            25.5050

: Has internal CHL in meter output

COLUMNS=6
N/U=1
N/U=2
IENGR=3
N/U=4
Chl=5    0.0077   81
N/U=6
```

2. Save the device file with a new name.
3. Refer to the steps in Save field characterization values in sensor on page 16 to save these values to the sensor in addition to the device file.
4. Select the *File* menu, then "Load Device File" in the software.
5. Select the new device file.
6. Go to the *FL-Setup* tab.
7. Push **Turn Engr Output ON** to turn the µg/L output on.
   Push **Start Data.** An additional column of data in units of µg/L shows in the *Raw Data* tab.

## 3.6 Device files

The software uses a sensor-specific device file to show the data in the *Plot Data* tab and to calculate the data output in engineering units. Each device file has three necessary elements. The device file is not necessary to use the software to set up and move data from a sensor.

1. The heading for the *Plot Data* tab.
2. The number of columns in the device file.
3. A description of the contents in each column.

***Plot Data* tab heading**
The first line of the device file shows the model number and the serial number of the sensor. This information appears on the top of the *Plot Data* tab in the software.

**Number of columns**
The column count shows how many columns of data the software will process. The format is COLUMNS=x.

**Description of columns**
Each column of data from the sensor comes from a description in the device file.

Number of columns=x

Date=x MM/DD/YY

Time=x HH:MM:SS

N/U=x not used

sc=scale factor

off=offset

IENGR=x

mw=measurement wavelength of the sensor

dw=display wavelength of the sensor

| Example of a fluorometer device file | |
|---|---|

## 3.7  Terminal program operation

Use Windows HyperTerminal®, Tera Term, or other terminal program as an alternative to the manufacturer-supplied software to operate sensors.

| baud rate: 19200 | stop bits: 1 | data bits: 8 | flow control: none | parity: none |
|---|---|---|---|---|

### 3.7.1  Common terminal program commands

| Command | Parameters | Description |
|---|---|---|
| !!!!! | none | Stops the data collected by the sensor. Lets the user to enter setup values.<br>If the sensor is in a low-power mode, turn the power supply off for one minute, then turn the power on and push the "!" key 5 or more times. |
| $ave | 1–255 | The number of measurements that make up each row of collected data. |
| $mnu | — | Prints the menu of setup values to the PC screen. |
| $pkt | 0–65535 | Sets the number of rows of data that are collected between the specified time intervals. |
| $rls | none | Gets the settings from the flash memory. |
| $run | — | Uses the current setup values to operate. |
| $sto | — | Saves the desired setup values to the flash memory. |

### 3.7.2  Terminal program commands for sensors with internal memory

| Command | Parameters | Description |
|---|---|---|
| $clk | 24-hour time | Sets the time in the internal memory in the format hhmmss. |
| $date | date | Sets the date in the internal memory in the format mmddyy. |
| $emc | — | Clears the internal memory. |
| $get | — | Reads data from the internal memory. Prints **etx** when it is complete. |
| $int | 24-hour time | Sets the time interval between sets of measurements the format hhmmss. |
| $mvs | 1 = ON; 0 = OFF | 1 = the Bio-wiper is open. 0 = the Bio-wiper is closed. |
| $rec | 1 = ON<br>0 = OFF | 1 = Turns on the sensor's internal memory.<br>0 = Turns off the sensor's internal memory. |
| $rls | — | Loads the settings from the flash memory. |
| $set | 0–65535 | Sets the number of rows of data that are output between low-power states. |

### 3.7.3  ECOView and terminal program differences

ECOView uses different but equivalent words for data collection options.

| ECOView | Terminal program |
|---|---|
# Section 4    Optional equipment

## 4.1  Test cable

Use a test cable to set up and test the sensor before deployment.

| One analog output connector | Two analog output connectors | No analog output |
| --- | --- | --- |

| | | | |
| --- | --- | --- | --- |
| **1** | six-contact connector | **3** | db-9 serial port connector |
| **2** | 9-volt battery connector | **4** | RCA connector(s) |

1. Connect the six-contact connector to the sensor.
2. Connect the 9-volt connector to a 9-volt battery. As an alternative, it can be connected to a regulated power supply.
3. Connect the db-9 connector to the PC. Use a USB-to-RS232 adapter cable if necessary.
4. Use a digital multimeter (DMM) to see analog output (if applicable) from the sensor. The inside of the RCA is signal (red DMM probe) and the outside is ground (black DMM probe).

## 4.2  Internal batteries

### ⚠ WARNING

The pressure housing of the *ECO* sensor must be opened to replace the batteries. If done improperly, it could result in personal injury or death due to abnormal internal pressure as a result of flooding. It may not be possible to repair flooded sensors.

The manufacturer disclaims all product liability from the use or service of these sensors. The manufacturer cannot control the use of these sensors or choose qualified personnel to operate them, and therefore cannot take steps to comply with laws pertaining to product liability, including laws that impose a duty to warn the user of any dangers involved with the operation and maintenance of the sensors. Acceptance of these sensors by the customer shall be conclusively deemed to include a covenant by the customer to defend and hold the manufacturer harmless from all product liability claims arising from the use and servicing of these sensors. Flooded sensors are serviced at the discretion of the manufacturer.

### ⚠ WARNING

The sensor may be under pressure. Do not point it toward any part of the body to remove the vent plug or end flange.

### ⚠ WARNING

Replace the batteries in a clean and dry environment. Gases in the sensor can expand and push the pressure relief plug open. This will flood the sensor. Do not replace batteries in a cold environment and then deploy the sensor in a hot environment.

Flooded sensors are usually not serviceable. There is a small chance that the manufacturer can get the data that is stored in the sensor. Contact service@wetlabs.com for more information about flooded sensors.

## Optional equipment

The manufacturer supplies six Ultralife® 9-volt lithium batteries to supply power to sensors that have internal batteries. The manufacturer recommends these batteries because six batteries supply approximately 6100 mAh, which is the highest capacity currently available.

The use of alkaline or lithium manganese dioxide ($LiMnO_2$) batteries will not damage the sensor but the capacity is much lower than UltraLife® batteries.

*Note: The nominal water temperature, sequence timing, sample periods, and other variables will change the use-time of the sensor's internal batteries.*

### 4.2.1 Remove batteries

1. Clean any debris from the end flange.
2. Dry the sensor thoroughly.
3. Remove the dummy plugs if necessary.
4. Point the connector end flange down, away from the face.

    a. Pull the vent plug loose.
    b. If the sensor has an external thermistor, pull it loose.

5. Dry the vent plug (and the thermistor, if applicable).
6. Use needle-nose pliers to remove the monofilament from the end flange.

**Figure 3  Pull monofilament from end flange**

7. Remove the end flange from the pressure housing.
   The jacking screws supplied as spare parts can be used to push the end flange off of the pressure housing, and then be removed.
8. Carefully disconnect each Molex® connector.
9. Remove the screw that holds the vent plug in the end flange.
10. Dry the end flange and the pressure housing seal areas.
11. Examine the O-rings on the vent plug and thermistor (if applicable).
    Remove any O-ring that is damaged.
12. Apply a light coat of vacuum grease on a new 010 O-ring and put it on the vent plug or thermistor.
13. Put the vent plug into the top of the end flange.
14. If applicable, insert the thermistor into the end flange again.
15. Put the screw for the vent plug in the inside of the end flange.
    The screw holds the vent plug in the end flange.
16. Carefully pull the white plastic loop to remove the battery pack from the pressure housing.
17. Remove the black plastic protectors from the ends of the long screws that secure the batteries.
18. Loosen, but do **not** remove, the retaining screws using a 1/4" slotted driver.
    Do not remove both screws. If both of the retaining screws are removed, the result will be a pile of parts and the replacement process will not be easy.
**Figure 4  Both retaining screws removed**

**19.** Disconnect each of the six batteries.

## 4.2.2  Replace batteries

Install new batteries in the sensor.

**1.** Tilt the battery board enough to connect the first battery in the contacts that are perpendicular to the other two.

**Figure 5  Connect the first battery**

**2.** Pivot the boards in the opposite direction to connect the other two batteries.
**3.** Connect the second set of the batteries.
**4.** Hold the assembly plates on top and bottom and tighten the screws.
The bottoms of the batteries may splay out. Make sure that the batteries do not extend beyond the circuit boards. If they do, the battery pack will scratch the sealing surface when it is put into the pressure housing again.
**5.** Install the bottom neoprene pad and the black plastic protective covers on the ends of the screws.
**6.** Remove and examine the 224 O-ring on the pressure housing for damage.
**7.** Use a new O-ring if necessary.
**8.** Apply a light layer of grease such as Dow Corning® High Vacuum Grease on the O-ring.
**9.** Put the battery pack into the pressure housing.
**10.** Attach the Molex® connectors.

Note that the dowel pin may be in the end flange or in the pressure housing.

**Figure 6  Inside of end flange**

| 1 | dowel hole | 2 | through-holes for jacking screws | 3 | vent plug screw |
|---|------------|---|----------------------------------|---|-----------------|

**11.** Put the end flange onto the housing so that the wires are out of the way.

**12.** Align the dowel pin with the dowel hole in the end flange, not the jack screw holes, which go through the end flange.

**13.** Make sure that the wires are not pinched between the end flange and the pressure housing.

**14.** Make sure that the end flange is attached to the pressure housing.

**15.** Install the monofilament in the end flange.

## 4.3  Bio-wiper and copper faceplate

The Bio-wiper and copper faceplate help decrease bio-fouling during extended deployments. The Bio-wiper is controlled manually using a controller, or it can work autonomously as pre-programmed before a deployment. The temperature and the depth at which the sensor is deployed will change the Bio-wiper cycle time.

### 4.3.1  Clean Bio-wiper and faceplate

Sensors that have copper faceplates and copper Bio-wipers need to be cleaned at regular intervals to keep the copper effective as an anti-fouling aid. Remove the Bio-wiper and faceplate from the sensor to clean them.

> ## *N O T I C E*
>
> Do not twist the Bio-wiper or the Bio-wiper shaft by hand. Push **Open Shutter** and **Close Shutter** in the software to turn the Bio-wiper. Turning by hand will damage the Bio-wiper motor.

**1.** Disconnect the sensor from any power source.

**2.** Use the manufacturer-supplied 3/32" hex key to loosen the screw that holds the Bio-wiper to the sensor.
If necessary, insert the manufacturer-supplied jacking screw into the expander hole to loosen the Bio-wiper. *PAR sensors do not have an expander hole and do not ship with jacking screws.*

**Figure 7  Bio-wiper screw holes**

| 1  the screw in the clamping hole | 2  the expander hole |
| --- | --- |

3. Lift the Bio-wiper off of the faceplate.
4. If used, remove the jacking screw.
5. Use a small Phillips screwdriver to remove the screws that attach the faceplate to the optics face.
6. Keep the screws.
7. Clean the Bio-wiper and faceplate with soapy water.
8. Rinse and dry thoroughly.
9. Use a Scotch-Brite® or similar pad to buff the Bio-wiper and faceplate until they are shiny.
10. Use an isopropyl alcohol-saturated cotton swab to clean the Bio-wiper shaft and the shaft hole.
11. Make sure the Bio-wiper and faceplate dry completely.
12. Attach the faceplate again.
13. Make sure the screw used to attach the Bio-wiper is in good condition.
    The 3/32" hex key must fit into the screw's socket.
14. If the screw is damaged, use a new screw from the spare parts kit that the manufacturer supplies with the sensor.
    These screws are 4-40 x 3/8" 316 stainless steel and are treated with anti-seize.
15. Insert a jacking screw into the expander hole of the Bio-wiper. Turn it slowly until the Bio-wiper goes onto the shaft easily.
16. Put the clean Bio-wiper over the shaft but do not twist the Bio-wiper.
17. Make sure to remove the jacking screw before tightening the 3/32-inch clamping screw.
18. Use the commands in the software to put the Bio-wiper into the closed position.
    The Bio-wiper covers the optics.
19. Set the clearance between the Bio-wiper and the faceplate to approximately 0.6 mm.
    *Note: If the Bio-wiper is has too much bend because it is too close to the faceplate, the motor will use too much current. If it is not close enough to the faceplate, the Bio-wiper will not keep the optics clean.*

**Figure 8  Bio-wiper clearance**

| 1 | Bio-wiper clearance from faceplate | 2 | Bio-wiper flex |
|---|---|---|---|

**20.** Use the 3/32" hex key to tighten the screw. Do not over-tighten the screw.

**21.** Turn on the sensor to make sure that the Bio-wiper rotates correctly.
The Bio-wiper must rotate 180 degrees and uncover the optics before they come on.
The Bio-wiper will then rotate 180 degrees to cover the optics after they come on.

## 4.4 *ECO* mounting bracket

The details of the mounting bracket for the *ECO* sensors are shown below. The mounting bracket is not installed on sensors with internal batteries or those rated to 6000 m depth.

## 4.5 Discontinued equipment: external thermistor

**This optional equipment is no longer available on new *ECO* sensors as of 15 June 2015.**

The calibration coefficient value for the thermistor is on the sensor's characterization page that ships with the sensor. The thermistor gives temperature output in counts. Do one of the methods below to change counts to engineering units.

1. Use the drop-down menu in the *Plot Data* tab of the software to see the thermistor output in °C.
2. Use MATLAB, MS Excel or other software to solve for:

   • Temperature, °C = (Output × Slope) + Intercept

## 4.6 Discontinued equipment: pressure sensor

**This optional equipment is no longer available on new ECO sensors as of 15 June 2015.**

The calibration coefficient value for the pressure sensor is on the calibration page that ships with the sensor. The pressure sensor gives pressure output in counts. Do one of the methods below to change counts to engineering units.

1. Use the drop-down menu in the *Plot Data* tab of the software to see the pressure sensor output in dbar.
2. Use MATLAB, MS Excel or other software to solve for:
   relative pressure, dbar = (output × slope) + intercept
3. Calculate the absolute pressure:

   • absolute pressure, dbar = relative pressure, dbar - relative pressure at atmospheric-water interface, dbar.

Set the pressure sensor to zero for each deployment. Do not deploy the pressure sensor deeper than the depth rating on the calibration page.

### Pressure sensor maintenance

The plastic fitting filled with silicone oil is a buffer between the pressure transducer diaphragm and seawater. Add silicone oil to the reservoir on top of the transducer at regular intervals.

1. Make sure the top of the sensor is clean.
2. Use a 9/16" wrench to hold the white nylon Swagelok® fitting.
3. Use a 7/16" wrench to loosen the cap on top of the fitting.
4. Remove the cap.
5. Use a wire or toothpick to clean the hole in the cap.

   • Do not blow compressed air into the fitting. It will make a mess.
6. Add Dow Corning® 200 Silicone Oil to the reservoir until the oil is in view.

**Figure 9  Pressure sensor cap**

7. Replace the cap. Make sure not to tighten the cap too much.
8. Clean any excess oil from the end flange of the sensor.

# Section 5 General information

Revised editions of this user manual are on the manufacturer's website.

## 5.1 Warranty

This sensor is warranted against defects in materials and workmanship for one year from the date of purchase. The warranty is void if the manufacturer finds the sensor was abused or neglected beyond the normal wear and tear of deployment.

## 5.2 Service and support

The manufacturer recommends that sensors be sent back to the manufacturer annually to be cleaned, calibrated, and for standard maintenance.
Refer to the website for FAQs and technical notes, or contact the manufacturer for support at support@seabird.com.

Do the steps below to send a sensor back to the manufacturer.

1. Complete the online Return Merchandise Authorization (RMA) form or contact the manufacturer.
   *Note: The manufacturer is not responsible for damage to the sensor during return shipment.*
2. Remove all batteries from the sensor.
3. Remove all anti-fouling treatments and devices.
   *Note: The manufacturer will not accept sensors that have been treated with anti-fouling compounds for service or repair. This includes AF 24173 devices, tri-butyl tin, marine anti-fouling paint, ablative coatings, etc.*
4. Use the sensor's original ruggedized shipping case to send the sensor back to the manufacturer.
5. Write the RMA number on the outside of the shipping case and on the packing list.
6. Use 3rd-day air to ship the sensor back to the manufacturer. Do not use ground shipping.
7. The manufacturer will supply all replacement parts and labor and pay to send the sensor back to the user via 3rd-day air shipping.

## 5.3 Waste electrical and electronic equipment

Electrical equipment that is marked with this symbol may not be disposed of in European public disposal systems. In conformity with EU Directive 2002/96/EC, European electrical equipment users must return old or end-of-life equipment to the manufacturer for disposal at no charge to the user. To recycle, please contact the manufacturer for instructions on how to return end-of-life equipment, manufacturer-supplied electrical accessories, and auxiliary items for proper disposal.
